TECHNICAL PORTFOLIO / OCTOBER 2026

IT Support & Service Desk Lab

Professional project report | Four completed Jira incidents and requests

A practical, simulated enterprise support environment integrating Active Directory, Windows 11, Windows file sharing, and Jira Service Management. The report distinguishes verified results from unresolved or out-of-scope work.

Prepared by	**Soranut Srisilapa-udom**
Environment	**support.test / Windows Server 2025**
Evidence base	**User-supplied lab screenshots**
Edition	**1.0**

Executive summary

This portfolio project documents four end-to-end service desk scenarios recorded in Jira Service Management and investigated on a Windows-based lab. All four tickets were shown in the Jira work list, and the ITLAB-4 ticket was explicitly shown as Resolved / Done. The other three tickets were also individually shown as resolved during the lab.

DOCUMENTED OUTCOME

Four Jira tickets resolved; account access restored, a lockout reproduced and investigated, share access corrected, and a new Finance employee provisioned with read-only permissions.

Environment & boundaries

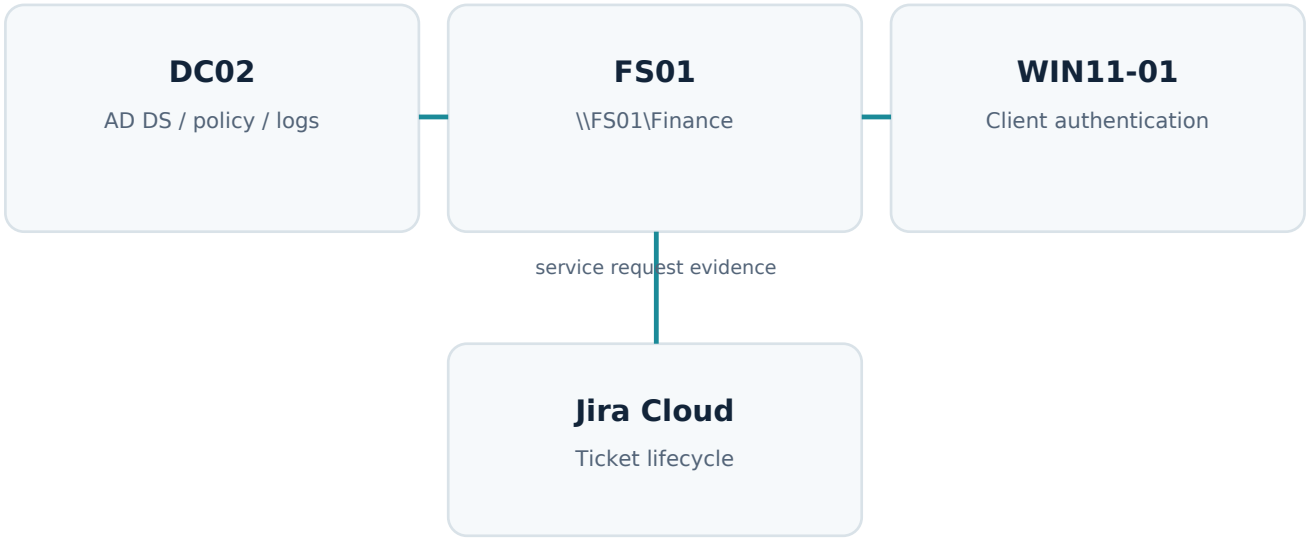

DC02 - Windows Server 2025 Desktop Experience	Active Directory management; domain controller used for account and security-log checks
FS01 - Windows Server	Hosts Finance share at \\FS01\Finance
WIN11-01 - Windows 11 Enterprise	Domain sign-in and client permission tests
Jira Service Management	Ticket creation, assignment, investigation notes, responses and resolution
Microsoft 365	Earlier tenant mentioned; Jamie onboarding not performed due to possible trial expiration

Security emphasis

- Use dedicated lab identities and avoid changes to administrative accounts.
- Apply access through Active Directory groups instead of assigning broad user-level rights.
- Record observations separately from corrective actions; preserve before-and-after evidence.
- Do not claim Microsoft 365 onboarding, password reset, or an independently verified unlock method when not demonstrated.

Environment architecture

The diagram below summarizes the functional relationships used in the scenarios. Network addresses are intentionally omitted because no complete verified IP plan was captured for this run.

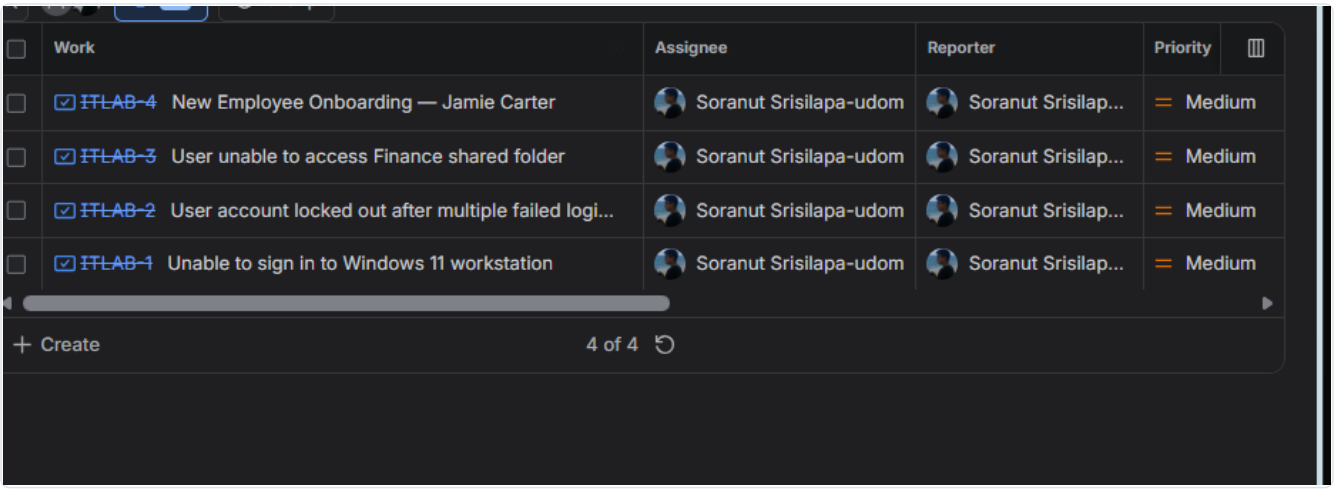

Identity and access model

Domain	support.test
Lab OUs	LabUsers; LabGroups; LabServers (visible in ADUC)
Finance.read	Share: Read; NTFS: Read & Execute, List folder contents, Read
Finance.modify	Share: Change + Read; NTFS: Modify and read-related permissions
Finance share	\\FS01\Finance (file-system location: C:\LabShares\Finance)

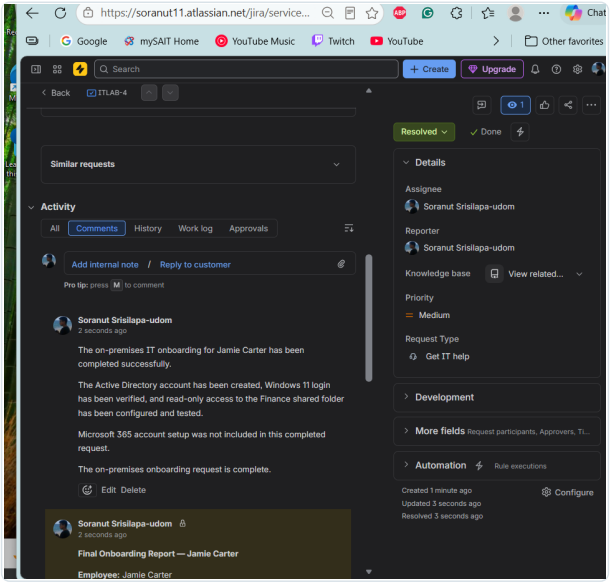

Effective SMB access depends on both the share and NTFS permissions. Folder-level results do not prove identical ACLs on every individual file. A file-level access issue was observed transiently in ITLAB-3 and subsequently no longer reproduced.

Resolved Jira work items

ITLAB-1	Windows 11 sign-in blocked	AD account enabled; Windows domain identity observed; Resolved / Done
ITLAB-2	Account locked after failed sign-ins	Five-attempt lockout evidenced; security event 4740; access restored; Resolved / Done
ITLAB-3	Finance share access denied	Finance.read membership added; read succeeds / create denied; Resolved / Done
ITLAB-4	Onboard fictional Finance employee	AD account, sign-in and least-privilege share access; on-prem scope resolved

EVIDENCE • Jira All work list displaying four completed ticket keys.

EVIDENCE • ITLAB-4 ticket showing Resolved / Done, customer reply and internal note.

Case 01 | Disabled AD account

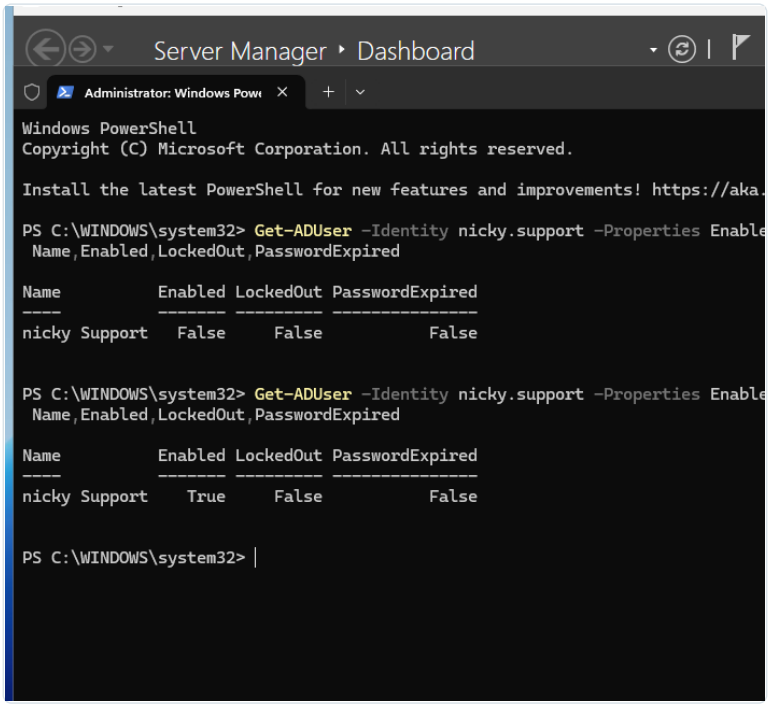

Ticket ITLAB-1 | A user was unable to sign in to a Windows 11 domain workstation.

Evidence and diagnosis

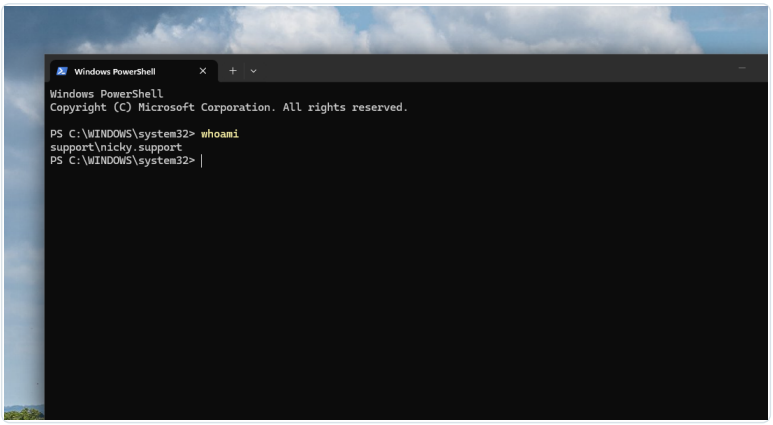

- The nicky.support account had Enabled = False, LockedOut = False, PasswordExpired = False.
- Windows displayed: "Your account has been disabled. Please see your system administrator."
- The account was enabled; subsequent PowerShell verified Enabled = True.
- A Windows session returned support\nicky.support from whoami.

Corrective workflow

The technician verified the account state through AD Users and Computers and PowerShell, re-enabled the lab user, and documented the result in ITLAB-1. No password reset was required for this scenario.

EVIDENCE • AD PowerShell before/after evidence: Enabled False changed to True.

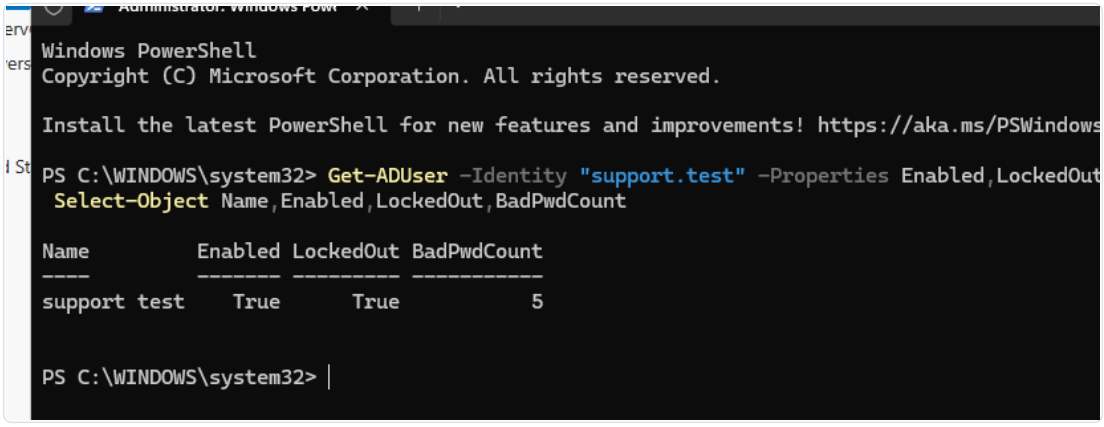

EVIDENCE • Windows whoami output confirming the nicky.support account context.

Case 02 | AD lockout and audit trail

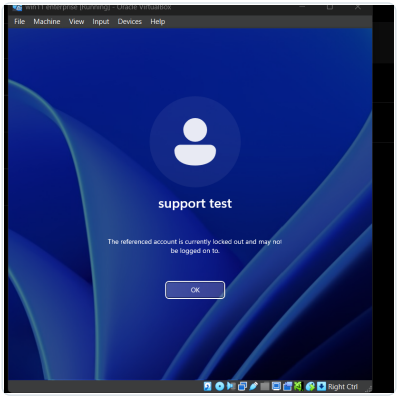

Ticket ITLAB-2 | A separate standard lab account, support.test, was used to simulate five invalid password attempts.

Policy and observations

Default lockout threshold	0 (disabled before fine-grained override)
Fine-grained policy	ITLAB-SupportLockout, precedence 10
Target principal	support.test (Domain Users only before test)
Threshold / duration / window	5 attempts / 10 minutes / 10 minutes
Account status at lockout	Enabled True; LockedOut True; BadPwdCount 5
Security record	Event 4740 on DC02; caller workstation WIN11-01
Recovery	LockedOut False and successful Windows domain sign-in verified

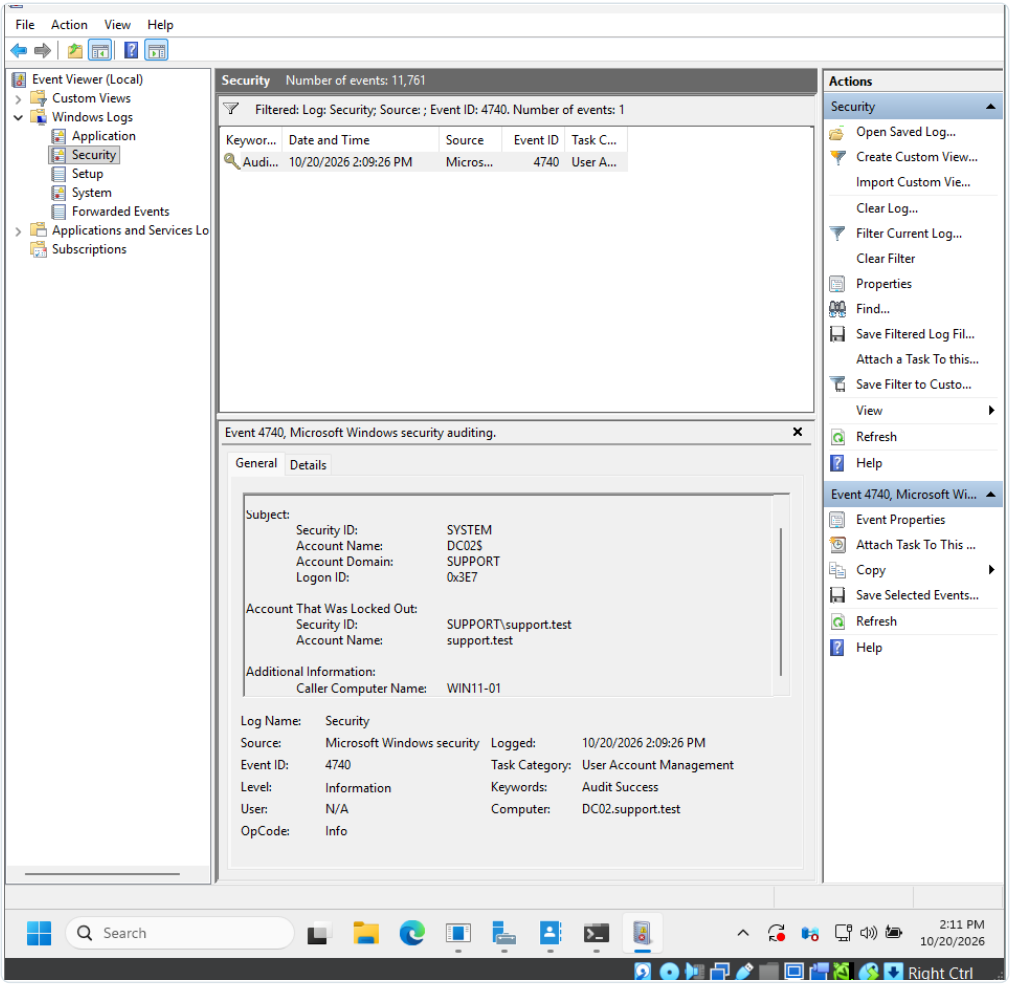

EVIDENCE • PowerShell output showing LockedOut True and BadPwdCount 5.

EVIDENCE • The Windows 11 logon screen displayed the account-lockout error.
The current state was recorded before the account was unlocked or allowed to expire. Event Viewer was then used to identify the originating workstation.

Case 02 | Security event analysis

Log / event ID	Security / 4740
Logged by	DC02.support.test
Locked account	support.test
Caller computer name	WIN11-01
Evidence significance	Links the account lockout to the workstation making the failed logon requests

EVIDENCE • Event Viewer, Security Event 4740: target support.test and caller WIN11-01.
Recovery limitation: access was restored, but the screenshot evidence does not establish whether unlock was manual or the configured timeout elapsed.

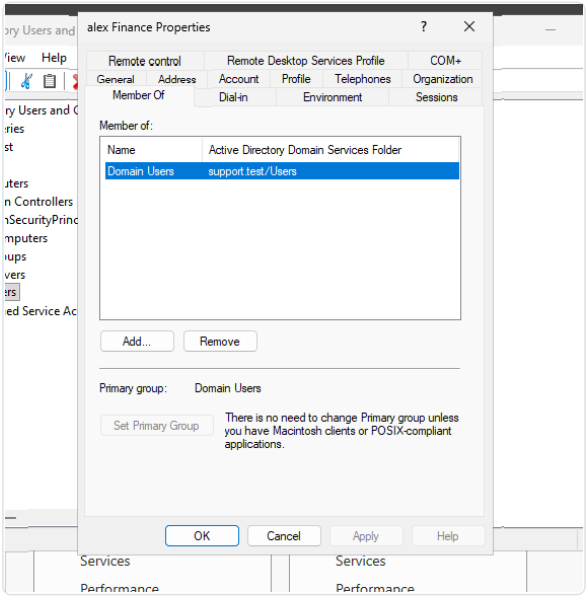

Case 03 | Finance share permission issue

Ticket ITLAB-3 | A user was unable to access the Finance share until the appropriate group membership was assigned.

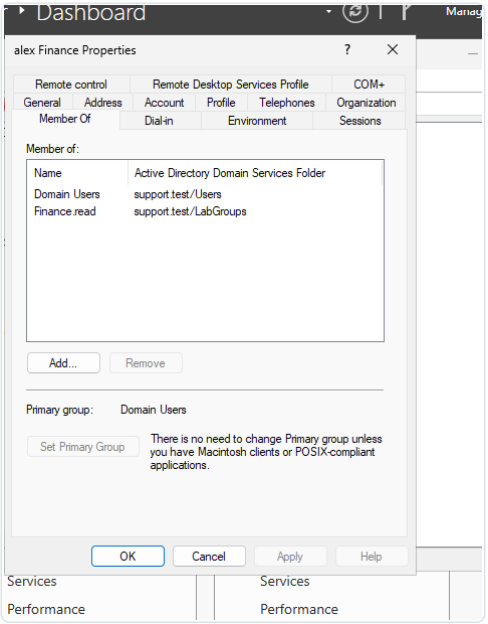

Diagnosis

- Share ACLs explicitly assigned Finance.read Read, Finance.modify Change + Read, and local Administrators Full Control.
- NTFS ACLs assigned Finance.read read-related rights and Finance.modify Modify rights.
- alex.finance initially belonged only to Domain Users, so no verified Finance group membership was present.
- After alex.finance was added to Finance.read, the user browsed \\FS01\Finance and opened test files; attempting to create a new file failed with an Access Denied dialog.

A transient file-specific read error was observed and subsequently not reproduced; its root cause was not established.

EVIDENCE • Before: Alex belongs only to Domain Users.

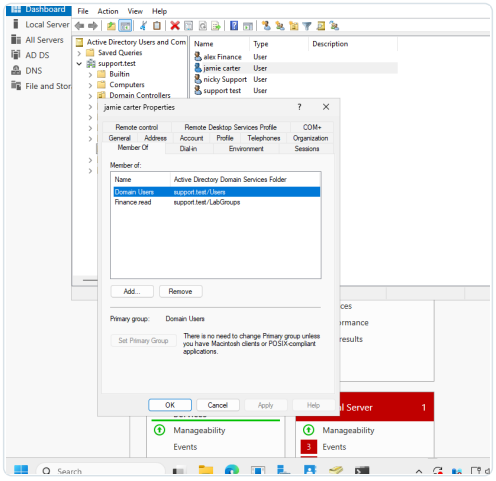

EVIDENCE • After: Finance.read appears in Alex's Member Of list.

Case 04 | On-prem employee onboarding

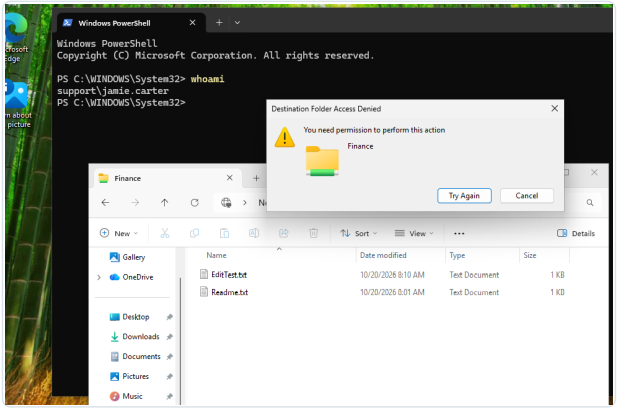

Ticket ITLAB-4 | A fictional Finance Assistant, Jamie Carter, was provisioned with standard domain access and least-privilege file share membership.

Provisioning and tests

Account identity	jamie.carter; Enabled True
AD membership	Domain Users, Finance.read
Client login	whoami returned support\jamie.carter
Share browsing	\\FS01\Finance opened and files listed
Read access	Both sample text files opened successfully
Write restriction	Create operation blocked by Destination Folder Access Denied
Cloud access	Microsoft 365 not configured; outside completed scope

EVIDENCE • Jamie member of Domain Users and Finance.read in ADUC.

EVIDENCE • Jamie cannot create a file in Finance; read-only control enforced.

Project outcomes and limitations

Skills evidenced

- IT service management: lifecycle from intake to investigation, internal updates, customer response and resolution.
- Identity and access: AD user creation, disabled-account recovery, security-group membership and standard-user logon.
- Authentication diagnostics: effective account-lockout policy, invalid logons, account state, security event 4740 and source-computer attribution.
- Windows file services: share ACLs, NTFS ACLs, Windows network paths, read-only validation and least-privilege correction.

Scope and evidence qualifiers

Environment	Controlled lab / fictional users; no production deployment claimed
Microsoft 365	Tenant status not verified during final ticket; cloud onboarding skipped
Account recovery (ITLAB-2)	Unlock outcome verified; manual vs automatic recovery not definitively evidenced
Authentication	Screenshots prove account identity and successful session; not a full identity-system security assessment
Finance file differences	Transient EditTest access denial later resolved without recorded root-cause evidence
Approval	ITLAB-3/4 approvals are scenario assumptions, not external production approvals

PORTFOLIO SUMMARY

Completed four simulated Jira service requests using Windows Server 2025 AD DS, Windows 11 Enterprise and SMB file shares. Demonstrated practical incident investigation, audit review, least-privilege identity administration, and documented ticket closure.

Screenshot provenance: all embedded screenshots were provided in the user's ChatGPT lab session (20-21 October 2026). Passwords and authentication secrets were not reproduced in the report.
